

## Fluted Centralizers

### Slickline Downhole Tools

#### Features

- Can be added anywhere in the tool string
- Flutes allow for fluid bypass while providing centralization

#### Benefits

- Robust, inexpensive method to centralize or standoff a tool string.

The Hunting Fluted Centralizer is designed to centralize wireline tool strings inside the tubing, during operations in deviated wells.

The centralizer is positioned above the running or pulling tool in the tool string, with an OD sized to suit the application. This also allows the centralizer to be used as a drift or gauge, in addition to centering the tool string.

Hunting Fluted Centralizers are available in various diameters and lengths. They are supplied with customer specified connections complete with fishing necks.
