

# Bell Guide Sets

## Slickline Downhole Tools

### Features

- Simple, robust designs
- Single sets used for different Pulling tool types

### Benefits

- Stackable, adaptable to fit operational requirements
- Allows use of Pulling tools in different pipe sizes without need for centralizers

Bell Guides are designed to fit over a given size of Pulling Tool, so that it can be easily centralised in larger ID tubing.

The Pulling Tool is connected inside the Bell Guide by its sucker rod pin connection, eliminating the need to add other adaptive tools onto the skirt tool to achieve the same result.

The Hunting Bell Guide Set gives the operator the maximum possible flexibility by nesting bell guides together allowing 2", 2 ½" or 3" Pulling Tools to be run with a guide of up to 6.00" diameter.
