

Hunting Spring Jars

Slickline Tools

Features

- Available in industry standard sizes 1.250" through 2.688".
- Available in the Hunting VariBall™ version for higher deviations.
- Inverted jar rod, offering additional resistance to debris.
- Simple and easy to redress and calibrate.

Benefits

- Robust design
- Easy to calibrate and redress
- Matched specifically to the Hunting Accelerator for optimum outputs

The Hunting Spring Jar is easily calibrated and tested at surface using the Hunting Calibration sub.

Once the jars are fired at the pre-calibrated tension, setting weight down on the tool string resets the Jars to their ready-to-fire state.

The Jars are configured in the inverted style making the mechanism less prone to clogging up with well debris.

When high deviation is an issue, the Hunting Jar can be offered in the VariBall / VariJar configuration, improving conveyance and operations in high angle wells.

Available in industry recognized connections including Sucker Rod, QLS and HD-QRJ.
