

Tubing Swages

Slickline Downhole Tools

Features

- Fluid Bypass ports
- Robust for heavy jarring
- Multiple sizes for most applications

Benefits

- Obstruction clearing allowing subsequent operations

Hunting Tubing Swages are designed to clear slight tubing collapse and other obstructions in the completion tubing string, allowing other services to be performed.

A tubing swage consists of a solid bar with an up-set in the middle and tapered at both ends. A center bore with lateral ports provides fluid by-pass.

Swages are available in a range of sizes to fit the need and have a customer specified top connection with fishing neck. The diameter of the tubing swage should be matched to the tubing it is being deployed in.
